Title: Management Strategy Evaluator = *User notes (beta ver. 6.0.6.1112)*

Subject: Ecopath Developer Site - ManagementProcedures

Version: 62

Date: 2019-12-12 01:03:40

Table of Contents

Management Strategy Evaluator = User notes (beta ver. 6.0.6.1112)	3
Inputs	3
Outputs	3

Management Strategy Evaluator = *User notes (beta ver. 6.0.6.1112)*

Inputs

Input uncertainty Sets inputs use for the perturbation of variables

Groups

- **CV** Coefficient of variation used for perturbation of biomass
- **Kalman weight** Kalman weight used for perturbation of biomass

Fleets

- **CV** Coefficient of variation used for perturbation of effort
- **Annual increase in catchability** Amount catchability will increase each year

Input reference levels Sets reference levels for performance evaluation and target fishing mortalities

- **MSY** Uses the results a Maximum Sustainable Yield search to set Biomass limit, Biomass base and F max. for the target fishing mortalities

Group Evaluation of model runs has not been implemented yet so setting of reference levels has no effect

- **Biomass lower** Lower biomass limit
- **Biomass upper** Upper biomass limit
- **Catch lower** Lower catch limit on a group
- **Catch upper** Upper catch limit on a group

Fleet

- **Lower** Lower catch limit by a fleet
- **Upper** Upper catch limit by a fleet

Input regulatory Sets inputs used for the fisheries regulations

Regulatory option Sets how the effort of a fleet will be regulated

- **Max effort** *Not implemented at this time.* Caps the effort of a fleet no matter what regulatory option has been chosen
- **Not used** No regulation will be used for this fleet
- **Effort** *Warning has not been tested or validated.* Effort is regulated by computing target fishing mortality using Biomass limit, Biomass base and F max. from estimated biomass. If target fishing mortality exceeds achieved fishing mortality fishing effort is scaled back.
- **Weakest Stock quota** Quota for the year is computed from Biomass limit, Biomass base and F Max using estimated biomass. Effort is regulated if any catch (landings + discards) on a group exceeds its quota.
- **Strongest stock + discards quota** Quota for the year is computed from Biomass limit, Biomass base and F Max using estimated biomass. Effort is regulated if landings on the strongest stock exceed the quota. Bycatch on other stocks is discarded.
- **Selective fishing quota** *still needs explanation*
- **Fleet Quotas** Quota by group and fleet used to compute fleet share of quota on a group.
- **Target fishing mort policy** Sets parameters for target fishing mortality. Biomass limit Biomass base and F max.
- **Fixed escapement** Sets fixed escapement biomass of a group. If this value is set then the quota for the year is computed as [estimated biomass] - [fix escapement] instead of using the target fishing mortality parameters.

Input effort tracking Sets weights used when evaluating current Ecosim scenario.

- **Objectives weights**
- **Ecological weights**
- **Fleet weights**

Outputs
